

Rules of Pseudocode:

1. Only one statement per line.
2. Capitalize initial keywords.
3. Indent to show hierarchy.
4. End Multiline Structures.
5. Keep statements language independent.

Note: The video series emphasizes that that there are no rules to pseudocode, only that it is readable by a non-coder. But there are some rules that I came up with from the series, as well as from my own research.
